CompSci 94
More Events
October 16, 2018

Prof. Susan Rodger
Class Today

• More types of events
  – Model manipulation
  – pointOfViewChanged
• Guarding events
• Adding a new Property and Counters
• Announcements
  – Your Exam 1 is on Gradescope
    • Request regrade by Friday, Oct 19
    • Solutions on the resources tab on course website under old tests
Setup for Lecture today

• Put in the objects:
  – Biped: Panda, whiteRabbit
  – Automobile: Hatchback, Sportscar
  – Shapes/Text: TextModel – name it counter
Event: DefaultModelManipulation

• Allows you to click on any object and move it
  – Click on it and drag it
  – Click with Shift key – move up and down
  – Click with Control (or CTRL) – turn an object
Try it! – objects moved and turned
Event: `pointOfViewChanged`

- Pick a character and events can happen based on this character's location changed.
Event: PointOfViewChanged (cont)

• I picked Panda
Whenever panda close to whiteRabbit

• Whenever the panda is close to the white rabbit, the white rabbit should tell him

• The event is with respect to the panda

• Move whiteRabbit? Move Panda?
Event Corresponds to Panda

- When you move the whiteRabbit close to Panda, nothing happens
- When you move the Panda close to the whiteRabbit, something does happen!
Properties

- A 3D object has its own:
  - *Procedures* – things it can do, like move, turn
  - *Functions* – values it can calculate like distance to, getHeight
  - *Properties* – data on its current state
    - Paint – what color it is
    - Opacity – all on are faded?
    - Width, height and depth
    - Vehicle
Change Properties

• What happens when this code executes?
Adding a new property to whiteRabbit

• Suppose we want to add a **new property** to the whiteRabbit, so it knows the maximum height it has jumped.

• Name it **howHighJumped**

• It’s type would be a **decimal number**.
Add jump proc, call it, what happens?

```
declare procedure jump with parameter: DecimalNumber = height
```

do in order

- this move UP, height
- this move DOWN, height
- this setHowHighJumped

```
declare procedure myFirstMethod
```

do in order

- this.whiteRabbit jump height: 1.0
- this.whiteRabbit jump height: 10.0
- this.whiteRabbit jump height: 2.0

```
say "My highest jump was " + this.whiteRabbit getHowHighJumped
```
Counter

• Want the Panda to count the cars by getting close to each car

• We need a 3D text to display the count. This is a 3D text showing a “String” as a 3D model. Note you cannot add a number to a string.

• We will also need a number property to add to and then redisplay the new number.
Create a 3D Text object
Create the 3D text counter

- 3D text counter
  - it's an object
  - Has a text field
  - set it to “0”

- Note cannot add a number to a string

- “0” + 1 doesn’t compute!

- Make it darker, I painted it Blue
Need to add a Number property to the 3D counter object

• Under `textModel` add a property
Under textmodel add 2 procedures

• setupCounter
  – What things do we need to do?

• updateCounter
  – What things do we need to do to update the counter?
Interactive Story: Counting Cars

• Want the Panda to first come close to the whiteRabbit who will tell him to count the cars by touching them. At this point we show the counter.
• The panda visits the cars and counts the two cars.
• Then the panda visits the whiteRabbit and this time he says “well done”
First update eventListener

- Have rabbit tell panda to count and initialize the counter
Create new `pointOfViewChangeListener` for panda

- Count a car when the panda is close to it
Run your program

- Have the panda get close to whiteRabbit, more than once, what happens?
- Have the panda get close to the cars, what happens? How many cars are there?
We need to **guard the events** so they only happen once, or when we want them to

- We only want the rabbit to tell the panda once to count the cars!
- We only want to count a car once!
- We need to make something happen the first time both of these occur, and then check for that later…. 
Guard getting close to whiteRabbit

• First set the 3D text to “hello”, then change it the first time the panda is close to the whiteRabbit.

• Change it to “0” in setupCounter
Guard getting close to whiteRabbit

- Check to see if contents are hello
- Change it to “0” in setupCounter
- This event can only happen once!
Guard getting close to cars

• Change something the first time panda is close to them so you can check it.

• Change the opacity of the car by 10% or more – I decided to set to 0% so invisible
Guard for the whiteRabbit to just say “great job” once

- Add two conditions, now it can only happen once
This lecture covered

• Two new types of events:
  – ModelManipulation
  – pointOfViewChanged
• How to guard an event so it only happens once, or when you want it to
• Adding a new property to an object
• Counter that displays its count
