Announcements

- Read Chapter 7, Sec 2, Reading quiz due
- Registration time coming up – CompSci 6
  - CompSci 4 prepares you to take CompSci 6
  - CompSci 6 need to know - Objects, methods, conditionals (if), repetition (loop), list or arrays (we will do)
  - Will review these topics in CompSci 6 with Java
- Assignment 5 storyboard due today
- Assignment 5 world due Tuesday
- Today
  - Definite loops (Chap 7.1)
  - More on variables (Timers/counters)

Repetition

- In many kind of animations, especially simulation and games, some actions happen again and again
  - Example
    - Games where targets randomly appear and are caught or shot down, then appear elsewhere
- Actions are made to happen again and again by running an instruction or method more than once

Example

- Bunny sneaks into garden and wants to eat broccoli. Bunny needs to hop several times over to broccoli
Bunny.hop

• Makes bunny hop up and down, making a sound and traveling .8 meters total
• See code in book
• How do we get bunny to hop many times over to the broccoli?

One solution

• What is the problem with this solution?

Counted Loop

• A counted loop is an alternative way to write repetitive code
• Repeats instructions a counted number of times

Demo - Code to hop 6 times

• The loop instruction executes a definite number of times, specified by a count
• Using a loop instruction
  – Saves time
  – Is convenient, easy to change the count
  – Can use a function in place of the count (must return a number)
Infinity times....

- If “infinity times” is selected for a loop, loop will run until the program is shut down

Example

- What happens if we make the other bunny hop up and down infinity times?

How do we fix this?

- How do we get both bunnies to move, one infinitely and one definitely?

More Complicated Loops

- It is possible to place a loop within another loop statement, this is nested loops
- Example in book: double ferris wheel

NOTE: Be Very Careful when using infinite loop! If something goes forever, it doesn’t stop!
Demo - Ferris Wheel
nested loops

Review: What is a Variable?

- Property that can be changed using *set*

Problem

- Given a cow that can randomly appear and disappear.
- Want to add a score to count the number of times user clicks on the cow.
- User gets specified amount of time to click (timer).
- Cow stops moving when time is up.
- User wins if a target number of clicks is achieved in the specified time. Cow tells user if they won or not.

Solution

- Add a new 3D text object
  - will keep track of times cow clicked on
  - type in “score,” as the name of the 3D text object
  - Then change its text value to 0

Drag *isShowing* tile into editor and select new value *false*
Add Mutable Variables

- What does Score need to keep track of?
  - current value
  - final value
  - increment value
- Add three mutable class variables

Increment Counter

- Add an event to increment score's value when mouse is clicked on cow
- Need to write a method to increase the score value
  - both variable and text displaying score must be changed

Mutable Variables Added

- Three variables added
- Write method to initialize them
- Call to initialize

First, change score.value

- Drag value over and set to score.value
- Use math to increase by increment
Second, display the new text value

- Each 3D text has a text value
- Drag this field and set
- A *world* built-in function can be used to display the number *value* as a string

Almost Done…

- Add another 3D text to just say the word score
  - I named it scoreText
  - Then changed text value to “score”
- Add code to repeat until target is reached
- Cow appears at end

ClassWork

- Start with ClickACow.a2w
- Add a Score
- Add a Timer – similar to score
  - Start at high value (say 20)
  - Count down instead
- Game is over when Timer runs down
  - If Target score is reached – you win
